at least one uniaxial optical compensation film over the second substrate;

a first alignment layer over the first substrate; and

a second alignment layer over the second substrate.

8. (Amended) A reflective-type liquid crystal display device, comprising:

first and second substrates;

a reflective electrode over the first substrate, said reflective electrode having an opaque

metal and being a surface with convex portions;

a liquid crystal layer between the first and second substrates;

at least one uniaxial optical compensation film over the second substrate; and

a first alignment layer having a plurality of first alignment directions over the first

substrate.

14. (Amended) A method for manufacturing a reflective-type liquid crystal display

device, comprising:

providing first and second substrates;

forming a reflective electrode having an opaque metal and being a surface with convex

portions over the first substrate;

providing at least one uniaxial optical compensation film over the second substrate; and

forming a first alignment layer having a plurality of first alignment directions over the

first substrate.
